Synopsis

The Colloid Science and Nanoscale Engineering Course discusses the principles and presents a broad interdisciplinary outlook in the areas of nanotechnology, innovative industrial products, bioarrays, sensors and microdevices. This course begins with an in-depth coverage of the fundamentals of colloidal interactions between surfaces, particles, surfactants and biomolecules, and their relevance to self-assembly. The theory and practice of particle characterization by scattering methods and their manipulation by external fields are presented. In the second part of the course, emerging colloid-related technologies in microfluidics, micropatterning, bioarrays and nanostructured materials are presented. Ways to apply the colloidal fundamentals to the engineering on the nanoscale are discussed.

Colloid science has for long provided the fundamentals of a wide range of practically important processes such as foam, emulsion and suspension stability, detergency, separations and product formulation. Vast areas of application of colloid science are currently being opened by the developing technologies of microfabrication, microfluidics, bioarrays and nanotechnology. Future progress in these areas will allow engineering on the nanoscale similarly to the way process engineering is presently done for larger scale units and operations.

The course is useful for students and scholars who want to understand the principles and use colloids and “wet” nanoscience in their research or future practice. The attendees should have intermediate level knowledge of thermodynamics and/or physics. The course will include a number of discussions, attendee presentations and other interactive activities.

Contents - CHE 596-009

Colloid Science
Surface tension, contact angles, wetting
Surfactants, self-assembly and detergency
Intermolecular and surface forces, DLVO theory
Interactions between biological molecules
Manipulation of colloids and biocolloids with external fields, optical and scattering methods

Nanoscale engineering
Microfluidics and lab-on-a-chip devices - principles and applications
Bioarrays and biosensors - principles
Nanoparticles and nanostructured materials
Microstructures with photonic and electronic functionality
